

## ASSIGNMENT 5

### AIM:

You have a business with several offices; you want to lease phone lines to connect them up with each other and the phone company charges different amounts of money to connect different pairs of cities. You want a set of lines that connects all your offices with a minimum total cost. Solve the problem by suggesting appropriate data structures.

### OBJECTIVE:

To understand the concept of minimum spanning tree and finding the minimum cost of tree using Kruskals algorithm.

### THEORY:

A spanning tree of the graph is a connected (if there is at least one path between every pair of vertices in a graph) subgraph in which there are no cycle. Suppose you have a connected undirected graph with a weight (or cost) associated with each edge. The cost of a spanning tree would be the sum of the costs of its edges. A minimum-cost spanning tree is a spanning tree that has the lowest cost. There are two basic algorithms for finding minimum-cost spanning trees: 1. Prim's Algorithm 2. Kruskal's Algorithm .

Kruskals's algorithm: It starts with no nodes or edges in the spanning tree, and repeatedly add the cheapest edge that does not create a cycle.

Steps of Kruskal's Algorithm to find minimum spanning tree:

1. Select the shortest edge in a network
2. Select the next shortest edge which does not create a cycle
3. Repeat step 2 until spanning tree has  $n-1$  edges.

Example:

The solution is

AB 1

ED 2

CD 4

AE 4

EF 5

Total weight of tree: 16

### ALGORITHM:

```

• Algorithm kruskal(G,V,E,T)
{
  1.Sort E in increasing order of weight

```

## SKILL DEVELOPMENT LAB-II 2018-19

```
2.let G=(V,E) and T=(A,B),A=V ,B is null
    set and let n =count(V)
3.Initialize n set ,each containing a different element of v.
4.while(|B|<n-1) do
    begin
        e=<u,v>the shortest edge not yet considered
        U=Member(u)
        V=Member(v)
        if( Union(U,V))
            update in B and add the cost
        } }
    end
5.T is the minimum spanning tree
}
```

### PROGRAM CODE:

```
#include<iostream>

#define MAX 999;

using namespace std;

class kruskal
{
private:
    struct node
    {
        int v1,v2,cost;
    }G[20];

public:
    int edges,vertices;
```

```

    void create();

    void mincost();

    void input();

    int minimum(int);

};

int find (int v2,int parent[])
{
    while(parent[v2]!=v2)
    {
        v2=parent[v2];
    }
}

void uni(int i,int j,int parent[])
{
    if(i<j)
        parent[j]=i;
    else
        parent[i]=j;
}

void kruskal::input()
{
    cout<<"enter number of companies"<<endl;
    cin>>vertices;
    cout<<"enter number of connection"<<endl;
    cin>>edges;
}

void kruskal::create()
{

```

## SKILL DEVELOPMENT LAB-II 2018-19

```
    cout<<"\n enter edges in v1-v2 form and corresponding
cost"<<endl;

    for(int k=0;k<edges;k++)
    {
        cin>>G[k].v1>>G[k].v2>>G[k].cost;
    }
}

int kruskal::minimum(int n)
{
    int i,small,pos;
    small=MAX;
    pos=-1;
    for(i=0;i<n;i++)
    {
        if(G[i].cost<small)
        {
            small=G[i].cost;
            pos=i;
        }
    }
    return pos;
}

void kruskal::mincost()
{
    int count,k,v1,v2,i,j,tree[10][10],pos,parent[10];
    int sum=0;
    count=0;
    k=0;
    for(i=0;i<vertices;i++)
```

```

        parent[i]=i;

while (count!=vertices-1)
{
    pos=minimum(edges);
    if(pos==-1)
        break;
    v1=G[pos].v1;
    v2=G[pos].v2;
    i=find(v1,parent);
    j=find(v2,parent);
    if(i!=j)
    {
        tree[k][0]=v1;
        tree[k][1]=v2;
        k++;
        count++;
        sum=sum+G[pos].cost;
        uni(i,j,parent);
    }
    G[pos].cost=MAX;
}

if(count==vertices-1)
{
    cout<<"spanning tree is"<<endl;
    for(i=0;i<vertices-1;i++)
    {
        cout<<tree[i][0]<<"-"<<tree[i][1]<<endl;
    }

    cout<<"cost required to set cables"<<sum<<endl;
}

```

```
    }

    else

    {

        cout<<"connection can't be set up"<<endl;

    }

}

int main()

{

    kruskal k;

    k.input();

    k.create();

    k.mincost();

}
```

### OUTPUT:

```
compilation terminated.
jugal@ubuntu:~/17u183/sem2/SD$ g++ KruskalAlgorithm.cpp

```

### CONCLUSION:

Kruskal's algorithm can be shown to run in  $O(E \log E)$  time, where  $E$  is the number of edges in the graph. Thus we have connected all the offices with a total minimum cost using kruskal's algorithm.
